

USER INTERFACE FOR NETWORKED PRINTER

ABSTRACT OF THE DISCLOSURE

[0076] A multifunction printer enables the printing of time-based media and is operated via a user interface. The user interface includes a touch screen for accepting command inputs and providing information to a user. Time-based media data is received by the printer from a media source specified via the user interface. A user specifies one or more multimedia processing functions for the printer to apply to the data. The printer performs the specified functions, and previews the output to the user via a display of the user interface. If the user decides to print the previewed output, the user specifies one or more output devices, such that the printer can print conventional printed output and/or to a specified electronic output.
